

We will tell about side effects of Amoxicillin. They are:

- allergic reactions: hives, skin hyperemia, erythematous rashes, angioedema, rhinitis, conjunctivitis; rarely - fever, arthralgia, eosinophilia, exfoliative dermatitis, multiforme erythema (including Stevens-Johnson syndrome); reactions similar to serum sickness; in isolated cases - anaphylactic shock.
- digestive system: dysbacteriosis, taste change, vomiting, nausea, diarrhea, stomatitis, glossitis, a moderate increase in the activity of "liver" transaminases, rarely - pseudomembranous enterocolitis.
- nervous system: nervous excitement, anxiety, insomnia, ataxia, confusion, behavior change, depression, peripheral neuropathy, headache, dizziness, epileptic reactions.
- laboratory indicators: leukopenia, neutropenia, thrombocytopenic purpura, anemia.
- other: difficulty breathing, tachycardia, interstitial nephritis, vaginal candidiasis, superinfection (especially in patients with chronic diseases or reduced resistance of the body).

## **How to Avoid Side Effects of Amoxicillin?**

Ideally, in order to choose the right antibiotic, you need to conduct a bacteriological study - to identify which pathogen caused the disease and make a test for its sensitivity to a particular drug. For this purpose, for example, with a bacterial infection, a smear is taken, inflammatory processes in the urinogenital system - urine, etc are examined. Results will be ready in 2-6 days. But in practice, most often the doctor prescribes an antibiotic empirically, based on his own experience and knowledge. In principle, it is normal, if before it - the case of the child.

But in fact we often pass from one out-patient department in another, we address to different experts. Therefore, parents should know by heart and inform the doctor: whether the child has a gastrointestinal tract, liver, kidney, endocrine disorders, is he inclined to allergic reactions, did he receive antibiotics before, what exactly and when.

The fact that the bacteria quickly develop resistance to the drug and in secondary use, it is not able to cope with them. Therefore, in such situations, an antibiotic of the second generation is immediately prescribed, which has a broader spectrum of action. Moreover, if you take Amoxicillin 500mg, grapple with contraindications and dosage to avoid severe side effects. There is a chance to buy Amoxicillin of Canadian drugs' production at an attractively low price.

Inform your doctor about any medications you take because there are meds which are incompatible with antibiotics.
